

# Virtual Sport Studio

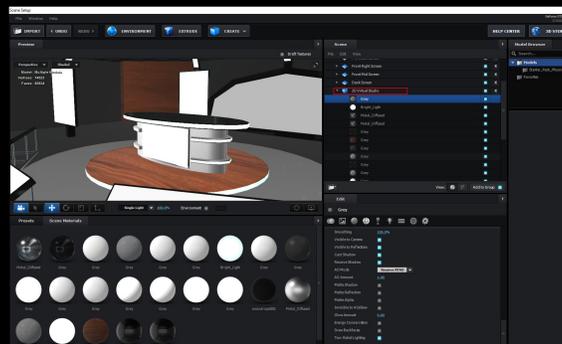

- Tutorial -

## 1.Importing Image/Video

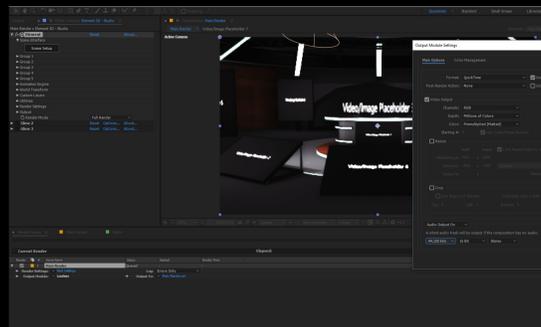

There are Video/Image placeholders for each screen. First import your video or image, you want to place inside the project. You can do that with right click at the project panel and use the option Import File... Once you've done that drag and drop the video/image inside the one of the placeholders.

## 2.Project Customization

To fully customize the studio, you have to select the layer with element 3d plugin and enter the scene. Select 3D Virtual Studio model and change the colors or textures.

## 3.Render Settings

To render the project open "Main Render" composition and press CTRL-M to send the scene in render queue. I personally recommend to use quicktime format encoding h.264 for good quality and to save render time.
